PROJECT PROFILE / GNANI AI GREAT INDIAN AI INTERNSHIP CHALLENGE

RESTURA

A Malayalam voice-powered restaurant ordering and kitchen coordination system

LIVE APPLICATION	REPOSITORY	PRIMARY USE
restura.streamlit.app	github.com/sajinkrishna14/livora	Restaurant order workflow

THE PROBLEM

Restaurant order-taking often depends on verbal communication and manual hand-offs. This can create delays, order-entry mistakes and friction when staff communicate orders in a regional language.

THE SOLUTION

Restura connects waiter, kitchen and restaurant operations in one workflow. Waiters can speak orders in Malayalam or Manglish, review the interpreted items, and submit confirmed orders for the kitchen to receive and acknowledge.

HOW THE SYSTEM WORKS

01 WAITER Records a spoken Malayalam / Manglish order.	**02 GNANI AI STT** Converts speech into text for processing.	**03 ORDER PROCESSING** Matches menu items and quantities; waiter reviews and confirms.
04 SUPABASE Stores and synchronises confirmed order data.	**05 KITCHEN** Receives the order and announces it using Gnani AI text-to-speech.	**06 ACKNOWLEDGEMENT** Kitchen confirms the order; the waiter receives the confirmation update.

CORE CAPABILITIES

- Malayalam / Manglish voice ordering
- Speech-to-text and text-to-speech
- Menu-item and quantity extraction
- Order review before submission
- Kitchen order receipt and voice announcement
- Kitchen acknowledgement sent back to waiter
- Owner interface for restaurant operations

TECHNOLOGY

Gnani AI — speech recognition and voice synthesis
Python — application logic and order processing
Streamlit — owner, waiter and kitchen interfaces
Supabase — persistent data and order synchronisation
Requests — API communication

PROJECT LEAD & DEVELOPER	PROJECT ASSISTANCE	INTENDED IMPACT
Abhiram B A — application development, system implementation, AI and database integrations, and interface development.	Sajin Krishna — project assistance.	Reduce manual order hand-offs and make restaurant workflows more accessible through regional-language voice interaction.

Project description reflects the implemented workflow as confirmed by the project team. Model/version labels are intentionally omitted pending verification against the deployed configuration.
